BLOG HUB

BLOGGING & PUBLISHING PLATFORM

UI/UX & Design System

Colour, type, layout and components across the reader, author and admin surfaces of Blog Hub.

Document BlogHub-UX-001

Version v1.0

Author Irham Saleha

Prepared for Blog Hub project documentation

1. PRINCIPLE

Three audiences, one system. The public surface is designed for reading and gets the most restraint; the author and admin surfaces are designed for working and can afford more density. Nothing about the interface should compete with an article body.

2. COLOUR

Token	Use
Ground	Near-white page background on the public surface; a faint grey on the working surfaces to separate panels.
Ink	Article body and headings; the darkest value in the system.
Accent	Primary actions, active navigation and links inside body copy.
State	One hue each for draft, in review, published and archived, used on status pills only.

3. TYPE

- A reading serif for article bodies at a measure of roughly 68 characters, with generous line height.
- A sans for interface chrome: navigation, dashboards, tables and forms.
- Three heading levels inside an article and no more, so a long post stays navigable.

4. LAYOUT

- **Public** — single centred column for articles; card grids for the homepage and category listings.
- **Author** — persistent left navigation, a summary row of counts, then the working area.
- **Admin** — the same shell as the author surface with table-first content, so switching roles is not disorienting.

5. COMPONENTS

- Article card — image, category, title, author and date, in a fixed order everywhere it appears.
- Status pill — fixed width, colour drawn only from the state palette.
- Editor — formatting toolbar, autosave indicator, and publish controls grouped away from destructive actions.
- Data table — sortable headers, one row action set, pagination fixed to the bottom.
- Moderation row — the comment in full, its article context, and approve or reject as the only two primary actions.
- Empty states — every list names the next useful action.
