HIREGEN AI

AI RECRUITMENT & CANDIDATE ASSESSMENT PLATFORM

UI/UX & Design System

Score visibility, explainability, editability and accessibility specification for the HireGen AI interface.

Document HireGen-UX-001

Version v1.0

Author Irham Saleha

Prepared for HireGen AI project documentation

1. SOURCE

This specification is the UX section of the HireGen AI PRD v1.0, expanded into a standalone reference for design and front-end implementation. The full functional specification remains in the Product Requirements Document.

2. SCORE VISIBILITY

- The AI Fit Score appears on every candidate card, in both list and detail views.
- Scores render as a colour-coded badge: green at 70 and above, amber from 40 to 69, red below 40.
- A single click on any score badge opens the explainability panel as a side drawer, without navigating away from the candidate list.

3. PIPELINE AND FLAGS

- The candidate pipeline supports drag-and-drop stage movement; every move writes an audit log entry, and moving a candidate backwards raises a confirmation dialog.
- Risk flags and authenticity badges appear consistently across all candidate views. Clicking a flag opens a tooltip with the supporting evidence; dismissing one requires a reason.

4. AI CONTENT EDITABILITY

- Every AI-generated artefact — job descriptions, emails, summaries, interview questions — is presented in an editable field.
- A regenerate control allows one-click regeneration with a different tone or focus.
- The recruiter chat assistant lives in a persistent side panel with message history, timestamps and a clear-session control, with suggested prompts for first-time users.

5. STATES

- Every list view — search results, shortlists, pipeline stages — carries an empty state naming a useful next action, such as broadening a search.
- All AI operations show a loading indicator with an estimated wait; anything running beyond five seconds switches to a progress message.
- The KPI dashboard is fully functional at desktop widths from 1280px, and widgets degrade gracefully — the salary widget hides rather than erroring when its data source is unavailable.

6. ACCESSIBILITY

All interactive elements meet WCAG 2.1 AA: keyboard navigable, screen-reader compatible, a minimum contrast ratio of 4.5:1, and a visible focus indicator on every interactive element.

7. COLOUR SYSTEM

Token	Use

Ground	Page and panel background — near-white, low visual weight so data is the focus.
Ink	Primary text and headings; the darkest value in the system.
Accent	Primary actions, active navigation, and the score-badge and status-pill palette.
Risk states	Green / amber / red reserved exclusively for score badges and risk flags — never reused for decoration.

8. COMPONENTS

- Score badge — fixed width, colour drawn only from the risk-state palette, click target extends beyond the visible pill.
- Explainability drawer — opens from the right without a route change; closing returns focus to the badge that opened it.
- Pipeline card — drag handle, stage indicator and risk flag in a fixed position across every stage.
- Chat panel — persistent, dismissible, with suggested prompts shown only when the history is empty.
- Data table — sortable headers, one row action set, pagination fixed to the bottom.
